## Fundamental Theorems of Calculus

Define derivative and describe verbal, graphical, numerical, and symbolic aspects.

Define definite integral and describe verbal, graphical, numerical, and symbolic aspects.

Suppose $f$ is defined by the graph.

Estimate $f^{\prime}(x)$ at each integer $x$ in the table.

| $x$ | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $f^{\prime}(x)$ |  |  |  |  |  |  |  |  |  |  |  |

Draw a graph of $f^{\prime}$.

Estimate $g(x)=\int_{0}^{x} f^{\prime}(t) d t$ at each integer $x$.

| $x$ | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $g(x)$ |  |  |  |  |  |  |  |  |  |  |  |

Draw a graph of $g$ on the axes containing the graph of $f$.

What is the relationship between $g$ and $f$ ?

## Fundamental Theorems of Calculus

Suppose today at 7:00AM was 43797.0 hours after David's car was built. Suppose $f(t)$ is the miles David's car has gone $t$ hours after it was built.
Interpret $\frac{f(43797.5)-f(43797.0)}{43797.5-43797.0}=30$.

Interpret $f^{\prime}(43797.25)=50$.

Suppose $g(t)$ is the miles per hour of David's car $t$ hours after it was built. Interpret $g(43797.0)(0.2)+g(43797.2)(0.1)+$ $g(43797.3)(0.2)=14$.

Interpret $\int_{43797.0}^{43797.5} g(t) d t=15$.

Restate the above in terms of the function $f$.
